

Maintenance of microfiber

Machine washing

Microfiber mops and microfiber cloths are machine washable at up to 95°C

They tolerate washing degrees down to 70°C, because the fibres open up at 67°C, where the water hoses the splitted fibres.

Do not wash microfiber products under 70°C, because the fibres will not be clean when washed at lower temperatures.

NB! Changed washing instructions for NMF's microfiber mops and microfiber cloths

Wash at minimum 80°C with regular liquid detergent – regardless wheres the products are used.

New corona virus gets inactivated at minimum 80°C and when using regular detergent, therefore there is no need to increase the dosage of detergent or use disinfectant, when you wash.

Under normal circumstances we recommend wash at minimum 67°C when products are used in areas with danger infection. We emphasise the importance of changing it to minimum 80°C to avoid spread of infectious disease.

The change applies to all NMF microfiber products regardless which area they are used in.

Drying

To dry microfiber mops and cloths with a tumbler, use one of following settings:

1. Use the cool tumble dry setting
2. Set it to cupboard dry, max 60°C.

Washing detergent

- Use regular detergent (Ph<10,5)
- Dose 1/3 of recommended dosage, as microfiber is self-cleaning at temperatures over 67°C
- Do not use washing enhancer
- Do not use fabric softener, as it encases the fibres (when used - wash again without fabric softener)
- Do not use chlorine or bleach, aside from what the detergent already contains

Textiles and machine washing

Remember always to wash the four different types of products separately, as the products contain different bacteria since they are used on different surfaces.

Wash separately with advantage, as the material keeps nap from other textile.

Use washing nets when washed with other textiles - especially textiles that leave lints
